Goals	To become acquainted with statistical models that can be used in life insurance.																
Description	The course aims at providing the students with statistical models that are useful in life insurance. We discuss methods to model mortality rates. A particular focus is on the Lee-Carter model and its extensions. We also learn how to estimate these models. Furthermore, students get an introduction to statistical models, in particular regression models, that are appropriate for lifetime distributions. For instance, we address the Cox-model, the AFT model and multiple decrement models. We then discuss how these models can be used to calculate life insurance premiums.																
Literature	Research articles, the slides of the course.																
Prerequisites	Probability Theory and Mathematical Statistics.																
Teaching methods	PBL / Presentation / Lecture / Assignment																
Assessment methods	Participation / Written Exam
