

## Course Descriptions Bachelor 2021-2022

Course Title Sustainability and Human Health  
Course Code EBC2188  
ECTS Credits 5,0  
Assessment Whole/Half Grades

Period	Start	End	Mon	Tue	Wed	Thu	Fri
1	30-8-2021	15-10-2021	X		X		

Level Intermediate/Advanced

Coordinator Maud Huynen, Ben Janssen For more information: [m.huynen@maastrichtuniversity.nl](mailto:m.huynen@maastrichtuniversity.nl); [b.janssen@maastrichtuniversity.nl](mailto:b.janssen@maastrichtuniversity.nl)

Language of instruction English

Goals Students are able to:  
\* understand what is meant with health (from a variety of perspectives);  
\* explore the basics of environmental health;  
\* explore the basics of planetary health;  
\* explain the relationship between sustainable development and mental health, sustainable work and sustainable behavior;  
\* reflect on the (central) role of human health in the sustainable development debate.

Description Human health is a key component in the sustainable development debate. For example, the first principle of the seminal 1992 United Nations Rio Declaration on Environment and Development states that "Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature". Similarly, the World Health Organization argues that "sustainable development cannot be achieved when there is a high prevalence of debilitating illnesses, and population health cannot be maintained without ecologically sustainable development". Throughout the course, students will reflect on the (central) role of human health in the sustainable development debate.

In the past the exploitation of the environment has benefited human health, for example by increasing food production to feed billions of people. However, the exploitation and contamination of the environment is now beginning to threaten our health. Hence, the same natural systems that have benefited humans for so long (by providing key ecosystem services in support of human wellbeing), are now suffering from the consequences of human activities.

This course will explore the linkages between human health and the environment from both an environmental health and planetary health perspective. Both fields examine the relationship between human health and conditions and exposures originating outside the body, such as extreme temperatures, chemicals (e.g. from medical waste), infectious diseases (e.g. COVID-19), or any number of other potential factors. Building on environmental health, however, planetary health explicitly accounts for the importance of natural systems in terms of averted cases of disease and the potential harm that comes from human perturbations of these systems.

Next to looking at physical health, this course will also explore mental health and well-being in relation to sustainable development, focusing on eco-anxiety, sustainable work and sustainable behavior. People around the world are increasingly suffering from mental health impacts as they are becoming more anxious about the impact of global environmental change (e.g. climate change) on the planet. Students will discuss the emergence of eco/climate-anxiety (and reflect about their emotional responses), examine how sustainable behaviour can be encouraged, and explore how long-term well-being can be improved through sustainable work.

Literature

Prerequisites None

Keywords

Teaching methods PBL / Presentation / Lecture / Groupwork

Assessment methods Written Exam / Presentation

Evaluation in previous academic year For the complete evaluation of this course please click <http://iwio-sbe.maastrichtuniversity.nl/rapporten.asp?referrer=codeUM>

This course belongs to the following programme / specialisation

UM-wide minors	Minor Sustainability
SBE Non Degree Courses	Minor Sustainability
